snapnow

Take snapshot of image for inclusion in published document

Syntax

`snapnow`

Description

`snapnow`, in a file being published, takes a snapshot of the most recently generated image or plot. The snapshot appears at the end of the code section that contains the `snapnow` command. For more information about publishing, see Publish and Share MATLAB Code. example

Outside of the context of publishing a file, MATLAB® interprets a `snapnow` command as a `drawnow` command.

Examples

collapse all

Capture Snapshot of Figure in Loop

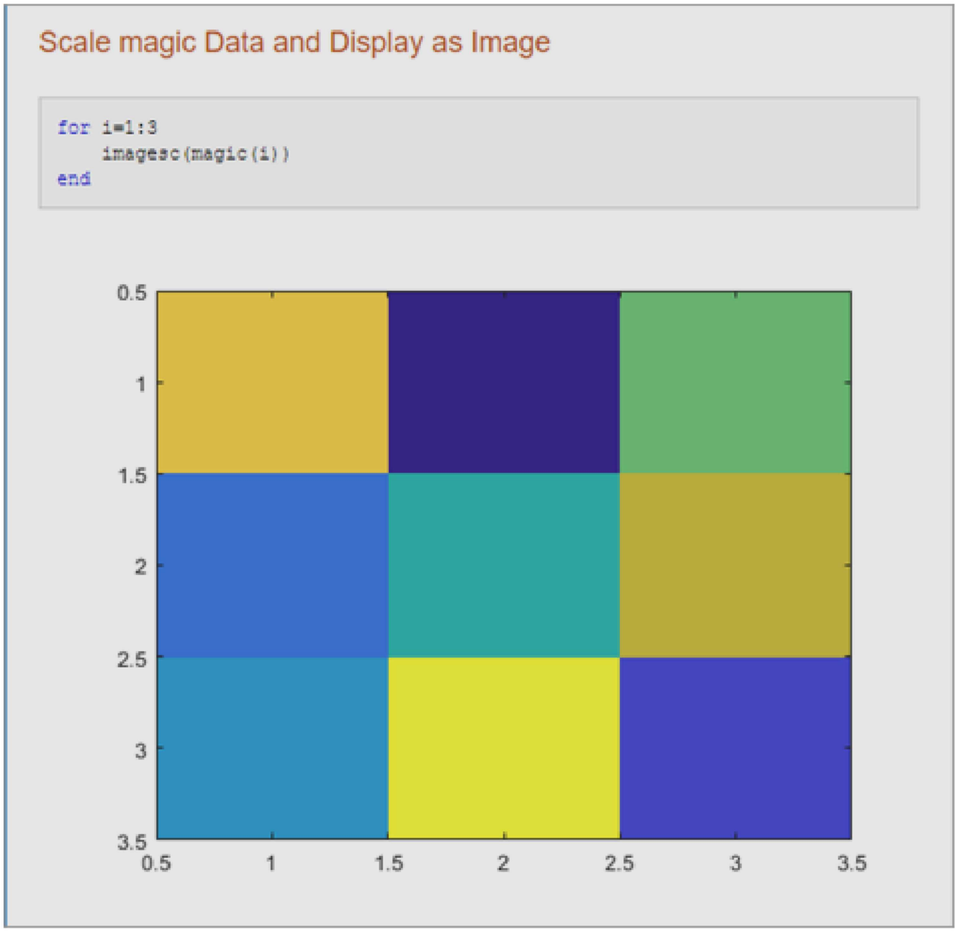
Use `snapnow` to capture a snapshot of an image after each iteration of a loop.

Create a file `loopIterations.m` with this code that runs a `for` loop three times and produces graphics after every iteration.

```
%% Scale magic Data and Display as Image
for i=1:3
    imagesc(magic(i))
end
```

Save and then publish the file. MATLAB displays the published file with only a snapshot of the final image.

```
publish('loopIterations.m')
web('html/loopIterations.html')
```

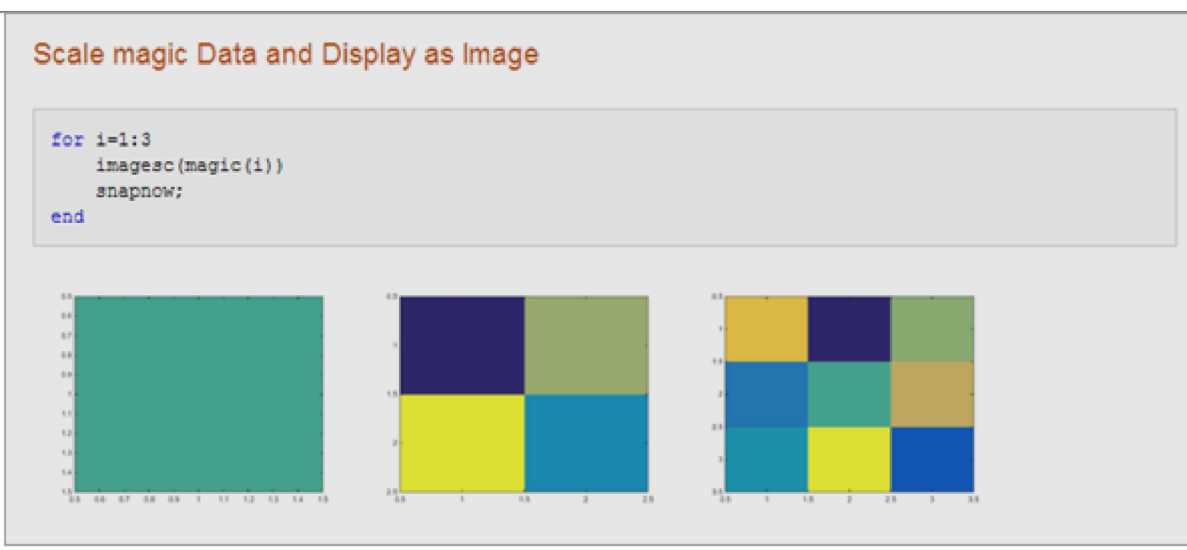


Add a call to the `snapnow` function inside the `for` loop.

```
%% Scale magic Data and Display as Image
for i=1:3
    imagesc(magic(i))
    snapnow;
end
```

Save and then publish the file. MATLAB displays the published file with a snapshot for each loop iteration.

```
publish('loopIterations.m')
web('html/loopIterations.html')
```



Version History

Introduced in R2008b
