

Create and Run Favorite Commands

MATLAB® favorite commands (previously called command shortcuts) are an easy way to run a group of MATLAB language statements that you use regularly. For example, you can use a favorite command to set up your environment when you start working, or to set the same properties for figures you create. To easily access your favorite commands, you can add them to quick access toolbar.

Create Favorite Commands

To create a favorite command:

1. On the **Home** tab, in the **Code** section, click **Favorites** and then click **New Favorite**. The Favorite Command Editor dialog box opens.
2. In the **Label** field, enter a name for the favorite command. For this example, enter Setup Workspace.
3. In the **Code** field, type the statements you want the favorite command to run. You also can drag and drop statements from the Command Window, the Command History, or a file. MATLAB automatically removes any command prompts (>>) from the **Code** field when you save the favorite command. When navigating using the keyboard, use **Esc** to move out of the **Code** field.

For example, enter these statements:

```
format compact
clear
workspace
filebrowser
clc
```

4. In the **Category** field, type the name of a new category or select an existing category from the drop-down list. If you leave this field blank, the favorite command appears in the default **Favorite Commands** category.
5. In the **Icon** field, select an icon.
6. To add the favorite command to the quick access toolbar, select both the **Add to quick access toolbar** and **Show label on quick access toolbar** options. For more information, see [Customize Quick Access Toolbar](#)

7. To run the statements in the **Code** section and ensure that they perform the desired actions, click **Test**.
8. When you are done configuring the favorite command, click **Save**.

To edit a favorite command, right-click the favorite command and select **Edit Favorite**. To delete a favorite command, right-click the favorite command and select **Delete Favorite**.

Run Favorite Commands

To run a favorite command, on the **Home** tab, click **Favorites**, and select the favorite command you want to run. All the statements in the **Code** field of the Favorite Command Editor run as if you ran those statements from the Command Window, although they do not appear in the Command History.

Organize Favorite Commands

You can organize your favorite commands by storing them in different categories.

To create a new category:

1. On the **Home** tab, in the **Code** section, click **Favorites** and then click **New Category**. The Favorite Category Editor dialog box opens.
2. In the **Label** field, enter a name for the category. For this example, enter `My Favorite Favorites`.
3. In the **Icon** field, select an icon.
4. To add the category to the quick access toolbar, select both the **Add to quick access toolbar** and **Show label on quick access toolbar** options. For more information, see [Customize Quick Access Toolbar](#).
5. Click **Save**.

To move a category up or down in the list of categories, or to move a favorite command within a category, drag the category or favorite command to the desired location. You also can use the Move category to top  and Move category to bottom  buttons to the right of the category.

To change whether a single category or favorite command appears in the quick access bar, right-click the category or command and select **Add to Quick Access Toolbar**. To add all favorite commands to the quick access bar, on the **Home** tab, right-click **Favorites** and select **Add to Quick Access Toolbar**.
