

Calling Functions

MATLAB® provides a large number of functions that perform computational tasks. Functions are equivalent to *subroutines* or *methods* in other programming languages.

To call a function, such as `max`, enclose its input arguments in parentheses:

[Open in MATLAB Online](#)
[Copy Command](#)

```
A = [1 3 5];
max(A)
```

[Get](#) ▼

```
ans =
5
```

If there are multiple input arguments, separate them with commas:

```
B = [3 6 9];
union(A,B)
```

[Get](#) ▼

```
ans = 1x5
```

```
1    3    5    6    9
```

Return output from a function by assigning it to a variable:

```
maxA = max(A)
```

[Get](#) ▼

```
maxA =
5
```

When there are multiple output arguments, enclose them in square brackets:

```
[minA,maxA] = bounds(A)
```

[Get](#) ▼

```
minA =
1
maxA =
5
```

Enclose any text inputs in quotes:

```
disp("hello world")
```

[Get](#) ▼

```
hello world
```

To call a function that does not require any inputs and does not return any outputs, type only the function name:

```
clc
```

[Get](#) ▼

The `clc` function clears the Command Window.
