

home

Send cursor home

Syntax

[home](#)

Description

`home` moves the cursor to the upper-left corner of the Command Window. `home` also scrolls all visible text in the Command Window out of view, giving the appearance of clearing the screen without deleting any text. After running the `home` command, you can use the scroll bar to view the previously displayed text. [example](#)

Use `home` in a MATLAB® code file to always display output in the same starting position on the screen without clearing the Command Window.

Examples

[collapse all](#)

Move Cursor to Home Position

Use the `magic` function to create and display a 5-by-5 integer matrix in the Command Window.

```
magic(5)
```

```
ans = 5×5
```

```
17    24     1     8    15
23     5     7    14    16
 4     6    13    20    22
10    12    19    21     3
11    18    25     2     9
```

Run the `home` function to scroll the displayed matrix and any other visible text out of view and to move the cursor to the upper-left corner of the Command Window.

```
home
```

Use the Command Window scroll bar to scroll back up and see the hidden text.

Version History

Introduced before R2006a
